

Dear Sir,

I wish to address the Secretary of Energy and those responsible of those in committee of the proposal of integrating the viability and availability of the renewable energy source E85 to the region in which I reside. In the region there are only two sources of E85, while unavailable to the mass population of E85 vehicles, it does promote a start with our independence and reliance on fossil fuels from other nations. In this address I would enter my proposal as a request for grant an exploration, and severe intent to obtain, an infrastructure of E85 outlets available to the public domain throughout the state of Florida, but also and exploratory viability and expansion of biodiesel technology for diesel fueled vehicles.

My intent is that there are no individual entrepreneurs trying to exacerbate the institutions of fossil fuel technology and increase the availability of alternative fuels to the American public. These are being withheld by the major oil companies and constrained with domain by the same oil manufactures as contracts with their individual licensees of their brands and outlets. This limitation of alternative fuel at a price commensurate with actual and available manufacturing costs to the American consumer is being withheld until such fossil based fuels may become too exhaustive or expensive for the American motorist to afford.

The American public deserves, nay, demands all alternative fuel source availability be made public and available at any location in the nation. Most all American families will attest to fuel prices being the biggest cost today, curtailing revenue to normal tourist, vacation and travel destinations. Increases in transportation costs are beginning to impact the consumer on goods and commodities as fuel surcharges are riddling throughout the sale to the consumer.

I would disingenuous, if I left only the NEW car buyer as moving toward and more inexpensive fuel without promoting and immediate investigation to alternatives in existing vehicle fuel availability demands be made available by automotive manufactures, at a cost to the consumer, to convert said vehicles to alternative options. These Americans have a stake in the consideration as well.

In this I would be privileged to continue our address and to consider a grant of the Secretary to move the United States further in energy alternatives and exploration of renewable energy resources.

Please feel free to contact me or my associate 813-404-1577 or 813-404-1575
